

# Certification options

<subject from profile/spec.md>

Run 1 · <YYYY-MM-DD> · scored against a scorecard frozen before research

**Not yet run.**

## The answer

*Not yet run.* Complete the intake, freeze the scorecard, run the research, then invoke the `recommend` skill to replace this file.

## Ranking

**No candidates survived.** Either the research has not run, or every credential surveyed failed a hard filter. If it is the latter, that is the finding: see [the research notes](#) and the excluded list below, and consider whether a filter in `objectives.md` is stricter than intended.

## How this was decided

The scorecard below was derived from the profile — subject, benchmark, learning preferences, objectives and budget — and frozen before any credential was looked up. Research scored against it without amending it.

*No criteria defined.* Run the `build-scorecard` skill.

## Comparison

*Nothing to compare yet.*

Generated by [Spec-Led-Certification](#). Scores and weights read from `scorecard/criteria.csv` and `research/scores.csv` at compile time; sources logged in `research/sources.md`.
